

1. The print average score function was hard for me to think about for a second but eventually I figured it out. My old week two class TestScores proved to be beneficial since some of the code was reused for the getLetterGrade function. They were also useful in checking for how to do some stuff in Java.
2. A final is a constant in Java; a variable that will never change. Void is a function type in which nothing is returned. A method is a function of a specific class. A method parameter is the definition of what variable someone using the method will pass into it, and the argument is what is actually passed in. Return is to return a value from a method/function.
